

Latvian Roundwood Trade Costs and Prices

Executive summary

Latvia's roundwood market in the latest fully official public data remains highly export-linked, operationally efficient by Baltic standards, and extremely sensitive to transport conditions, labour inflation, and swings in downstream export demand. The strongest official Latvian price evidence readily retrievable in this run comes from the Central Statistical Bureau's half-year roundwood purchase-price series and from Ministry of Agriculture / CSB wood-flow tables; those sources are strong on *transaction benchmarks* and product-flow structure, but much weaker on a full public stumpage series and on an annual, publicly exposed assortment-by-species production matrix. In parallel, sectoral market reviews from e-silva and Mežabirža fill important gaps for 2024–2025 pulpwood, sawlog and fuelwood market levels, but they are market-review sources rather than official statistics. ¹

On costs, the official Latvian benchmark is clear: in 2023 the average total logging cost was **€25.4/m³ in final felling** and **€31.6/m³ in thinning**, both up year on year; the official statistics office attributes the increase mainly to labour remuneration, transport and technology costs. Public LVM procurement materials also give unusually concrete transport formulas: an example roundwood haul of **78 km** and **30 m³** is shown at **€119.70/trip** for one loading point, equivalent to about **€3.99/m³**, while the same haul with three loading points is **€131.40/trip**, about **€4.38/m³**. For energy wood, LVM's public payment rules show transport as a €/km plus €/ber.m³ formula and chipping at **€2.61/ber.m³** in the example. ²

The main cost drivers in 2025–2026 were labour, fuel, weather-related logistics disruption, certification and compliance overhead, and export-market sentiment. Gross wages in Latvia rose by **7.7% in 2025** to **€1,815/month** economy-wide, while total standard social-insurance payroll taxation remained **34.09%** of covered wages, split **23.59% employer** and **10.50% employee**. Diesel prices in Latvia were near **€1.46–1.48/litre** in May–June 2025 but spiked to roughly **€1.92/litre** in mid-March 2026. On the logistics side, the 2026 spring thaw imposed **10-tonne mass limits on hundreds of gravel-road sections**, sharply increasing seasonal haulage risk and forcing route/time adjustments. ³

The bottom-line implication is that Latvian delivered roundwood prices are best understood as the sum of four layers: stumpage, harvesting/forwarding/loading, road transport, and commercial/compliance overhead. Because a complete public Latvian stumpage time series by assortment was not retrieved in this run, the most defensible analytical approach is to treat stumpage as a **derived residual** from delivered or first-purchase prices after subtracting measured operating costs. In representative 2024 conditions, that residual moved much more violently for high-value assortments such as veneer and larger sawlogs than for fuelwood; this is consistent with export-market exposure, while lower-value assortments were more directly pulled by energy and pulp demand. ⁴

Market structure and source base

For Latvia, the public source base is strong but uneven. The official tables most relevant to this run are: **MEI020** for average roundwood purchase prices, **MEK010** for production/import/export of wood products, and **MEZ012** for felled area and growing stock by dominant species. Together, these show that the public statistical system does contain the right building blocks for an analytical model, but not all

numeric cells are exposed in search-indexed excerpts, and the accessible pages do not by themselves yield a full assortment-by-species national production matrix in one place. ⁵

State-forest volumes are, however, public and useful as a market anchor. LVM reported **7.44 million m³** of roundwood assortments sold in 2024 and **7.06 million m³** of roundwood sold in 2025. Those are not national totals, but they confirm the scale of the state-forest supply base and they also show how weather and market conditions affect realized output year to year. LVM explicitly states that Latvian roundwood demand and price formation are strongly influenced by the foreign markets where Latvian wood processors sell finished output. ⁶

The peer-reviewed literature supports that export orientation. A recent academic review of Latvia's timber sector reports that the majority of domestically produced construction-grade timber and related wood products were exported in 2017–2023, and that the post-2021 downturn reflected geopolitical instability, sanctions impacts and slower construction demand. That does not replace a roundwood-destination table, but it is consistent with the market behaviour seen in Latvian sawlog and pulpwood pricing over 2023–2025. ⁷

Official Latvian data series that exist and are usable

Series	Coverage shown publicly	What it gives	Usefulness for this run	Main limitation
CSP MEI020 average roundwood purchase prices	2006 H2–2025 H2	Domestic roundwood transaction-price benchmarks by assortment/diameter	High	The basis is “purchase price”; it is not a clean public stumpage series. ⁸
CSP / Ministry MEK010 wood products production, import, export	2017–2024	National product-flow table for industrial roundwood, fuelwood, chips, pellets, sawn timber, charcoal	High	Search-indexed page exposed dimensions, not all numeric cells in this run. ⁹
VMD MEZ012 felled area and growing stock	2014–2024	Species structure of felled stock by dominant species and cut type	High	Not an assortment table; no direct product split. ¹⁰
UNECE market forecast tables	2024–2026	Country-level roundwood production/trade forecasts by product family	Medium	Country workbook download exists, but numeric Latvian cells were not directly exposed in retrieved excerpts. ¹¹

Production volumes by assortment and species

Because the no-fabrication standard is more important than table completeness, the table below separates *what is publicly confirmed to exist* from *what was numerically retrievable in this run*.

Requested series	Official source located	Numeric extraction status in this run	Comment
National roundwood production by assortment, annual 2015–latest	MEK010, Ministry/CSP	Partial only	Official table confirmed for 2017–2024, but search-indexed excerpt exposed dimensions rather than numeric rows. ⁹
National roundwood production by species, annual 2015–latest	VMD MEZ012	Partial only	Official annual felled stock by dominant species is public for 2014–2024, but it is not an assortment split. ¹⁰
Combined assortment × species matrix, annual 2015–latest	No single official public table retrieved	No public source retrieved in run	This is the most important data gap for a full simulation-grade model.

Domestic prices

The cleanest official Latvian pricing evidence retrieved here is the CSP half-year purchase-price series. It clearly captures the post-pandemic boom, the 2023 correction and the late-2024 rebound in conifer sawlogs. For birch assortments, the 2022 official release shows the exceptional 2020–2022 upswing. These are strong domestic transaction benchmarks, but because the retrieved excerpts did not fully expose CSP methodology text, I treat them as **first-purchase / market transaction benchmarks of unspecified VAT basis**, not as a pure stumpage series and not as a guaranteed delivered-to-mill series.

¹²

Official Latvian half-year price points retrieved from CSP

Assortment	2020 H1	2021 H1	2022 H1	2022 H2	2023 H1	2023 H2	2024 H1	2024 H2	Source
Birch veneer logs 18–24 cm	72.5	102.0	127.4	—	—	—	—	—	CSP release on 2022 H1 prices. ¹³
Birch veneer logs >24 cm	72.2	104.0	131.4	—	—	—	—	—	CSP release on 2022 H1 prices. ¹³
Birch sawlogs 18–24 cm	54.8	71.3	91.0	—	—	—	—	—	CSP release on 2022 H1 prices. ¹³

Assortment	2020 H1	2021 H1	2022 H1	2022 H2	2023 H1	2023 H2	2024 H1	2024 H2	Source
Pine sawlogs 18–26 cm	—	—	—	92.3	82.0	77.7	76.3	95.3	CSP release on 2024 H2 prices. ¹⁴
Pine sawlogs >26 cm	—	—	—	101.3	90.4	86.3	85.5	107.2	CSP release on 2024 H2 prices. ¹⁴
Spruce sawlogs 18– 26 cm	—	—	—	94.4	88.1	80.4	75.6	92.0	CSP release on 2024 H2 prices. ¹⁴
Spruce sawlogs >26 cm	—	—	—	104.8	95.1	84.5	82.1	97.8	CSP release on 2024 H2 prices. ¹⁴

The visual pattern is clear even from the partial official series: birch veneer and birch sawlogs surged between 2020 H1 and 2022 H1, while conifer sawlogs peaked in 2022 H2, fell through 2023 and 2024 H1, and then rebounded sharply in 2024 H2. ¹⁵

The chart above uses only CSP values explicitly exposed in the retrieved official Latvian release on 2024 H2 prices. ¹⁴

Latvian market-review prices for pulpwood, sawlogs and fuelwood

Official public series for Latvian pulpwood and fuelwood were not exposed as completely as the sawlog purchase series, so the best transparent supplement is e-silva and Mežabirža market reporting. These sources show the same broad cycle as the official data: strong 2024 spring pricing for pulpwood and sawlogs, followed by a softer 2025 second half, especially in energy wood and pulp assortments. ¹⁶

Period	Pine / spruce sawlogs	Birch pulpwood	Conifer pulpwood	Firewood / fuelwood	Basis note
Early 2024	—	about 55 €/m³	about 57–58 €/m³	—	e-silva market review; basis described as market prices, not official statistic. ¹⁷
April 2024	average about 85 €/m³, best-quality pine up to ~96 €/m³	61–62 €/m³	74–75 €/m³	about 50 €/m³	e-silva market review. ¹⁸

Period	Pine / spruce sawlogs	Birch pulpwood	Conifer pulpwood	Firewood / fuelwood	Basis note
Start of 2025	birch sawlog market broadly stable around 85–100 €/m ³	55–57 €/m ³	about 60 €/m ³	42–45 €/m ³	Mežabirža annual review. ¹⁹
Summer 2025 low	pressure in conifer sawlogs; pulpwood market corrected	about 48 €/m ³	about 48 €/m ³	—	Mežabirža annual review. ¹⁹
End of 2025	birch sawlogs firmer; conifer sawlogs recovering	about 52 €/m ³	about 48–52 €/m ³	36–38 €/m ³	Mežabirža annual review. ¹⁹

Representative stumpage inference

Because a public Latvian stumpage series by assortment was **not** retrieved, the most defensible way to estimate stumpage is to subtract measured operating costs from a delivered or first-purchase price. Using April 2024 market-review prices, official 2023 Latvian logging-cost benchmarks, and LVM's published transport tariff example at roughly 75 km, a representative **residual stumpage** works out roughly as follows: **pine sawlog €61–75/m³**, **birch pulpwood €37–41/m³**, **conifer pulpwood €50–54/m³**, and **firewood €26–29/m³**. These are not official prices; they are transparent **INFERENCES** assuming roughly €17.5–20.0/m³ for forest operations and about €3.9–4.2/m³ for transport. ²⁰

Cost structure and sensitivities

Latvia's official logging-cost data show a significant increase through 2023. Average logging cost rose to **€25.4/m³ in final felling** and **€31.6/m³ in thinning**; the statistics office points directly to increases in labour remuneration, transport and technology costs. That makes these figures the most important “all-in forest operations” anchors for Latvian cost modelling. ²¹

Academic and applied Latvian studies help break those totals into operational components. In conifer thinning in Latvia, one study estimated a **Logset 5HP GT harvester** cost of **€8.02/m³** at productivity of **13.85 m³/productive hour**. A separate Latvian study of a compact machine system in sanitary felling reported productive-hour costs of **€92/hour for the harvester** and **€78/hour for the forwarder**, with harvester productivity around **5.35 m³/hour** in small-diameter conditions. Another Latvian study found that biomass production including harvesting, forwarding and road transport to **50 km** could be produced at around **€14.3/m³** in early thinning with small machines, while forwarder productivity in thinning could average **8.63 m³/hour** for short forwarding distances. These are stand-specific research values rather than market tariffs, but they are very useful cost-building blocks. ²²

Latvian operating cost table

Item	Unit	Low	Base	High	Year / basis	Source quality
Total logging cost, final felling	€/m ³	—	25.4	—	Latvia, 2023 official average	High. ²³

Item	Unit	Low	Base	High	Year / basis	Source quality
Total logging cost, thinning	€/m ³	—	31.6	—	Latvia, 2023 official average	High. ²³
Harvester cost in conifer thinning	€/m ³	—	8.02	—	Latvia field trial	Medium-high. ²⁴
Harvester productive cost	€/hour	—	92	—	Latvia sanitary-felling trial	Medium. ²⁵
Forwarder productive cost	€/hour	—	78	—	Latvia sanitary-felling trial	Medium. ²⁵
Forwarder productivity in thinning	m ³ /hour	—	8.63	—	Latvia small-machine thinning	Medium. ²⁶
Biomass chain cost including 50 km road transport	€/m ³	—	14.3	—	Latvia, early thinning	Medium. ²⁷
Roundwood truck tariff, volume term	€/m ³	—	0.61	—	LVM procurement example	High for LVM-type contract context. ²⁸
Roundwood truck tariff, distance term, 1 loading point	€/km per trip	—	1.30	—	LVM procurement example	High for LVM-type contract context. ²⁸
Roundwood truck tariff, distance term, 3 loading points	€/km per trip	—	1.45	—	LVM procurement example	High for LVM-type contract context. ²⁸
Energy-wood chip transport volume term	€/ber.m ³	—	0.98	—	LVM payment rule example	High for LVM-type contract context. ²⁹
Energy-wood chip transport distance term	€/km per trip	—	0.69	—	LVM payment rule example	High for LVM-type contract context. ²⁹
Chipping	€/ber.m ³	—	2.61	—	LVM payment rule example	High for LVM-type contract context. ²⁹

Haulage cost by distance band

Using the published LVM formula for a **30 m³** roundwood load, the linehaul equivalent cost is approximately:

Distance band	One loading point	Three loading points	Comment
0–50 km	€1.69–2.78/m ³	€1.82–3.03/m ³	Baseline tariff only. ²⁸

Distance band	One loading point	Three loading points	Comment
50–100 km	€2.78–4.94/m ³	€3.03–5.44/m ³	Baseline tariff only. ²⁸
100–150 km	€4.94–7.11/m ³	€5.44–7.86/m ³	Baseline tariff only. ²⁸
150–200 km	€7.11–9.28/m ³	€7.86–10.28/m ³	Baseline tariff only. ²⁸

These are *not* universal Latvian spot-market rates. They are a documented LVM contract-calculation example and therefore best understood as an efficient baseline under organized procurement conditions. Waiting time, poor access, low payload, thaw restrictions, and multi-point loading can materially raise realized cost. LVM's own payment system explicitly includes waiting-time and special-operation add-ons beyond the base formula. ²⁸

Sensitivity analysis

A transparent scenario analysis can be built from the sources above. If a delivered pine or spruce sawlog price is held constant, then almost every extra euro of operating cost comes straight out of stumpage. In a representative 75 km haul scenario, a **10% change in trucking tariff** changes delivered cost by roughly **€0.39–0.42/m³**. A **10% change in total final-felling cost** changes delivered cost by roughly **€2.54/m³**, because the official final-felling average is €25.4/m³. This is why labour and machine-cost inflation tend to compress stumpage quickly when mill prices stall. ³⁰

Fuel is the sharpest short-term variable. Retail diesel in Latvia moved from about **€1.455/litre** in the week of 12 May 2025 to **€1.478/litre** on 23 June 2025, then to about **€1.919/litre** in mid-March 2026. Even though retail pump prices are not identical to fleet bunker prices, the change is directionally large enough that a high-haul, low-value assortment such as fuelwood or pulpwood would have suffered margin compression unless buyers accepted higher delivered prices. ³¹

Export demand affects the whole stack from the top down. LVM states plainly that Latvian roundwood demand and prices depend on the international markets for processed wood products, and LVM's 2024 results note that slower activity in wood-product export markets fed through into lower roundwood prices. In practice that means export-demand shocks are mostly transmitted into stumpage first, then into harvesting schedules and only later into transport availability. ³²

Trade flows and regional comparison

The public Latvian foreign-trade releases give a strong picture of export dependence at the broad “wood and articles of wood; wood charcoal” level. In selected recent months, wood exports were **€265.7**

million in October 2024, €259.2 million in November 2024, €243.4 million in February 2025, €283.4 million in March 2025, €241.1 million in May 2025, €241.4 million in July 2025, €276.1 million in October 2025, and €220.5 million in December 2025. These are not roundwood-only values, but they show the strong and persistent weight of wood in the Latvian export basket. ³³

For product flows rather than values, the official national table **MEK010** covers industrial roundwood, fuelwood, wood chips/residues, pellets, sawn timber and charcoal for **2017–2024**. For country-level forward-looking trade and production projections, UNECE market forecast tables for **2024–2026** are also officially available. What I did **not** retrieve as a clean public numeric output in this run is a roundwood-specific export table by destination country. That should therefore be treated as a priority follow-up extraction from Eurostat Comext or UNECE country tables rather than guessed here. ³⁴

Trade-flow table

Flow type	Coverage	Latest period publicly confirmed here	Main limitation
National production / imports / exports of industrial roundwood, fuelwood, chips, pellets, sawn timber	Official MEK010	2017–2024	Numeric rows not fully exposed in retrieved excerpt. ⁹
Broad monthly wood export values	Official CSB foreign-trade releases	Through Dec 2025, Mar 2026 trade release cycle	Broad chapter-44 style export category, not roundwood-only. ³⁵
Country forecast tables for roundwood production and trade	Official UNECE	2024–2026	Requires workbook extraction beyond exposed excerpt. ³⁶
Destination × product roundwood exports for Latvia	Not numerically retrieved	—	No public numeric table retrieved in run.

Comparison with Estonia, Lithuania, Finland and Sweden

Cross-country comparisons are useful, but basis differences matter a lot. Finland’s Luke data are largely **standing-sale stumpage** and **delivery-sale** prices. Sweden’s Skogsstyrelsen data distinguish **harvesting assignments** and **delivery timber** and changed methodology in 2025. Latvia’s CSP series are **purchase-price benchmarks**. Lithuania and Estonia both have public market information, but a robust 2025–2026 assortment-price pull for those countries was not completed in this run, so the table below marks those cells explicitly rather than filling them with weak estimates. ³⁷

Metric	Latvia	Estonia	Lithuania	Finland	Sweden
Diesel price, week of 23 Jun 2025, €/litre	1.478 ³⁸	1.507 ³⁸	1.509 ³⁸	1.781 ³⁸	1.520 ³⁸

Metric	Latvia	Estonia	Lithuania	Finland	Sweden
Latest readily retrievable official sawlog benchmark	Pine 18–26 cm €95.3/m ³ ; spruce 18–26 cm €92.0/m ³ , 2024 H2 purchase-price benchmark ¹⁴	No robust 2025–2026 official assortment-price value retrieved in run	No robust 2025–2026 official assortment-price value retrieved in run	2025 stumpage: pine logs €80.45/m ³ ; spruce logs €82.88/m ³ ³⁹	2025 harvesting assignment: pine sawlogs 991 SEK/m ³ sub; spruce sawlogs 1,195 SEK/m ³ sub ⁴⁰
Latest readily retrievable official pulpwood benchmark	Market-review level only in this run; conifer pulpwood ~€48–63/m ³ through 2025 reviews ⁴¹	Not retrieved	Not retrieved	2025 stumpage: pine pulpwood €31.12/m ³ ; spruce pulpwood €33.30/m ³ ; delivery sales about €51–53/m ³ ³⁹	2025 harvesting assignment: conifer pulpwood 639 SEK/m ³ sub; delivery timber 698 SEK/m ³ sub ⁴⁰
Fuelwood benchmark	Latvian market reviews: ~€36–50/m ³ in 2024–2025 ⁴¹	Not retrieved	Not retrieved	Not included in the cited annual Luke table	2025 harvesting assignment fuelwood price available and Q1 2026 fuelwood around 472 SEK/m ³ sub ⁴⁰
Structural note	Strong export pull; LVM sold 7.44m m ³ in 2024, 7.06m m ³ in 2025 ⁴²	Private-forest market information exists, but was not numerically extracted here	State forest enterprise sells about 3.6m m ³ raw timber per year ⁴³	Large, transparent official trade and price reporting ³⁹	Highly transparent official price reporting, but 2025 methodology changed ⁴⁰

The strategic message from the comparison is straightforward: Latvia enjoys a clear freight-cost advantage over Finland on diesel alone, but Swedish and Finnish official price structures remain more transparent and more frequently published. That transparency itself reduces trading friction and should be understood as a competitiveness factor. ⁴⁴

Drivers, policy and uncertainties

Labour and payroll taxes are an immediate cost driver. Latvia's average gross monthly wage reached **€1,815 in 2025**, up **7.7%** year on year, and the standard social-insurance contribution rate remained

34.09%, split **23.59% employer** and **10.50% employee**. For harvesting contractors, haulage firms and timber yards, the relevant point is not only the wage level but the total employer cost wedge. That means even a modest rise in nominal wages pushes all labour-intensive links higher at once: harvesting, forwarding, scale/yard handling and truck driving. ⁴⁵

Fuel and logistics remain the most volatile short-run drivers. The EC weekly fuel data show Latvia's diesel price changed materially even within 2025, and the March 2026 spike was especially severe. On top of that, spring thaw restrictions in 2026 imposed **10-tonne road mass limits** on as many as **775 gravel-road sections**, with explicit bans on special haulage permits during thaw periods. For roundwood, that is not just a transport issue; it changes the feasible harvesting calendar, roadside stock duration and mill-delivery sequence. ⁴⁶

Forest-road infrastructure is a medium-term cost determinant rather than a monthly market variable. LVM maintains a forest-road network of more than **12,500 km** and reported that in 2025 it carried out construction/reconstruction on **107 km**, surface renewal on **229 km**, and total maintenance / development work over **336 km**. Better roads reduce seasonal inaccessibility and transport cost variability; weak roads do the opposite. ⁴⁷

Certification matters in two ways: market access and administrative cost. PEFC Latvia reports more than **1.716 million hectares** certified in Latvia, more than **130 chain-of-custody certificates**, and more than **30 forestry-contractor certificates**. FSC's official fee system confirms that annual administration fees are turnover-based, but public Latvian all-in certificate cost schedules were **not** retrieved in official form during this run. In other words, certification is clearly widespread and commercially important, but precise Latvian cost benchmarks remain a data gap unless one collects auditor quotations or certificate-holder disclosures directly. ⁴⁸

Policy has recently reduced some compliance uncertainty but not eliminated it. Latvia's Ministry of Agriculture states that implementation of the EU Deforestation Regulation was postponed by one year, so it now applies to large companies from **30 December 2026** and to small / micro companies from **30 June 2027**. Separately, the Latvian government reduced the maximum allowable final-felling area in state forests for **2026–2030** by **9.5%** versus the previous period. Both changes matter directly for fibre availability, audit/documentation burden and trading strategy. ⁴⁹

Exchange-rate effects are secondary for domestic euro-denominated costs but still matter through export competitiveness and invoicing. Eurostat reports that in 2023 Latvia invoiced **78%** of extra-EU exports in euro, while in 2024 euro also dominated Latvia's extra-EU imports. The direct implication is that Latvia has less external-currency exposure than some peers, but not none: Sweden's SEK-denominated market remains an obvious relative-price channel for Nordic trade comparisons. That is best treated as a **competitiveness** driver rather than a primary **cost-accounting** driver. ⁵⁰

Data gaps and recommended further collection

The single biggest gap is the lack of a publicly exposed Latvian annual matrix that combines **assortment and species** into a single production series from **2015 to latest**. The official building blocks exist, but not in a way that was numerically retrievable from indexed public excerpts in this run. The correct next step is a direct pull from the Latvian official statistics database or API for **MEK010**, paired with **MEZ012** and, ideally, Ministry of Agriculture annual forestry data files. ⁵¹

The second major gap is a clean Latvian **stumpage** time series by assortment. Official public prices retrieved here are transaction benchmarks, and market reviews are mostly delivered / first-purchase

style narratives. For a trading simulation, stumpage should therefore be captured directly from: standing-timber auctions, private-forest co-operative sale records, e-silva closed-auction data, and large industrial procurement price cards. Without that, stumpage must remain a derived residual rather than a direct time series. ⁵²

The third gap is destination-level trade. Official broad wood export values are easy to obtain, and official product-flow tables exist, but a clean **Latvia roundwood exports by destination and product** table was not retrieved numerically in this run. That should be extracted from Eurostat Comext or UNECE country forecast tables in the next research pass rather than approximated. ⁵³

A practical data-collection agenda for the next run is therefore clear. First, export official table values directly from CSP / PxWeb rather than relying on indexed web snippets. Second, gather closed auction data for standing timber and roadside lots from e-silva and co-operatives. Third, collect actual contractor rate sheets or anonymized invoices for harvesting, forwarding and trucking by distance band and stand quality. Fourth, obtain a small sample of FSC / PEFC audit quotations to turn certification from a qualitative driver into a quantified overhead item. This would move the model from “analytically robust” to “simulation-grade precise.”
